

#### Change log:

This update package support RPI2 ,RPI3,RPI3B+ hardware.

In theoretically it possible to support CM3,but not test due to hardware interface is not compatible.

Package name: setup-pi3b+tft.tar

Kernel version: Linux4.14.52

#### Instructions:

We provide this package support in two ways:

- 1, We provide pre-installed image based 2018-06-27-raspbian-stretch , you can direct flash it in your TF card.
- 2, firmware package only.

About the first way please refer to the user manual, here we only show the second way

In user manual system firmware update stage the instruction we need to execute as below:

```
pi@raspberrypi:~/setup/firmware$ ./setup_rpi.sh
```

here we didn't execute this instruction any more instead we need to copy *setup-pi3b+tft.tar* package to /home/pi through USB flash disk or other way you can do it.

Next ,execute below command to update your system firmware.

```
sudo tar -xvf setup-pi3b+tft.tar -C /
```

This can make sure your OS can support the latest RPI3B+ hardware.
